# ENGINEERED WOOD Construction Guide

# **WOOD** The Miracle Material

**Engineered wood products are a good choice for the environment.** They are manufactured for years of trouble-free, dependable use. They help reduce waste by decreasing disposal costs and product damage. Wood is a renewable, recyclable, biodegradable resource that is easily manufactured into a variety of viable products.

# A few facts about wood.

• We're growing more wood every day. Forests fully cover one-third of the United States' and one-half of Canada's land mass. American landowners plant more than two billion trees every year. In addition, millions of trees seed naturally. The forest products industry, which comprises about 15 percent of forestland ownership, is responsible for 41 percent of replanted

forest acreage. That works out to more than one billion trees a year, or about three million trees planted every day. This high rate of replanting accounts for the fact that each year, 27 percent more timber is grown than is harvested. Canada's replanting record shows a fourfold increase in the number of trees planted between 1975 and 1990.

• Life Cycle Assessment shows wood is the greenest building product. A 2004 Consortium for Research on Renewable Industrial Materials (CORRIM) study gave scientific validation to the strength of wood as a green building product. In examining building products' life cycles – from extraction of the raw material to demolition of the building at the end of its

long lifespan – CORRIM found that wood was better for the environment than steel or concrete in terms of embodied energy, global warming potential, air emissions, water emissions, and solid waste production. For the complete details of the report, visit <u>www.CORRIM.org</u>.

• Manufacturing wood is energy efficient. Wood products made up 47 percent of all industrial raw materials manufactured in the United States, yet consumed only 4 percent of the energy needed to manufacture all industrial raw materials, according to a 1987 study.

Material	Percent of Production	Percent of Energy Use
Wood	47	4
Steel	23	48
Aluminum	2	8

• Good news for a healthy planet. For every ton of wood grown, a young forest produces 1.07 tons of oxygen and absorbs 1.47 tons of carbon dioxide.

Wood: It's the miracle material for the environment, for design, and for strong, lasting construction.

engineered wood products are used in a wide range of construction applications. Time-tested panel products are used in traditional wood-frame construction and in combination with other engineered wood products and systems. For low in-place cost, versatility, and superior performance, engineered wood systems are simply hard to beat.

This guide from APA is designed as a reference manual for both residential and commercial construction. It contains up-to-date information on APA Performance Rated Panels, glulam, I-joists, specification practices, floor, wall and roof systems, diaphragms and shear walls, fire-rated systems and methods of finishing.

If what you want to know about engineered wood construction systems isn't fully explained here, chances are it is in one of our many other publications. Simply write for the appropriate title or titles cited throughout this publication. Product and application information can also be found on the APA web site, at www.apawood.org. Or, for individual assistance with specific application questions or problems, contact the APA Product Support Help Desk at (253) 620-7400.

## NOTICE:

The recommendations in this guide apply only to products that bear the APA trademark. Only products bearing the APA trademark are subject to the Association's quality auditing program.

# **ROOF CONSTRUCTION**

# **APA Panel Roof Sheathing**

The recommendations for roof sheathing in Table 26 apply to APA RATED SHEATHING Exposure 1, Exposure 2 or Exterior, and APA STRUCTURAL I RATED SHEATHING Exposure 1 or Exterior. Uniform load deflection limits are 1/180 of span under live load plus dead load, and 1/240 under live load only. Special conditions, such as heavy concentrated loads, may require constructions in excess of these minimums, or allowable live loads may have to be decreased for dead loads greater than 10 psf, such as tile roofs. Panels are assumed continuous over two or more spans with the long dimension or strength axis across supports.

Note: The Span Rating in the trademark applies when the long panel dimension or strength axis is across supports unless the strength axis is otherwise identified.

RECOMMENDER UNITORNA ROOF UNIT CLIFATIUNIC (c) AND ADA

each support, except two equally spaced between supports 48 inches on center or greater), lumber blocking, or other. For low slope roofs, see Table 27

(e) Applies to panels 24 inches or wider applied over two or more spans.

(f) Also applies to C-C Plugged grade plywood.

(b) 20 inches for 3/8-inch and 7/16-inch panels. 24 inches for 15/32-inch and 1/2-inch panels.

(c) Includes APA RATED SHEATHING/CEILING DECK.

(g) Check with supplier for availability.

Form No. E30T = © 2005 APA – The Engineered Wood Association = www.apawood.org

Good performance of built-up, single-ply, or modified bitumen roofing applied on low slope roofs requires a stiffer deck than does prepared roofing applied on pitched roofs. Although APA Span-Rated panels used as roof sheathing at maximum span are adequate structurally, an upgraded system is recommended for low slope roofs. Table 27 provides recommended maximum spans for low slope roof decks. Recommended live loads can be determined from Table 26, and minimum fastener requirements are given in Table 28. Increased nail schedules may be required in high wind zones. Recommended nail schedules for high wind zones are described in APA Data File, Roof Sheathing Fastening Schedules for Wind Uplift, Form T325, available from APA.

#### TABLE 27

RATED	23/32	24 ос	32	1
STURD-I-FLO	OR 7/8	32 oc	48	2

(a) Low slope roofs are applicable to built-up, single-ply and modified bitumen roofing systems. For guaranteed or warranted roofs contact membrane manufacturer for acceptable deck. Low-slope roofs have a slope that is less than 2/12 (2"/foot).

(b) Edge support may also be provided by tongue-and-groove edges or solid blocking.

#### FIGURE 21

#### **APA PANEL ROOF SHEATHING** Panel clip or tongue-and-groove APA RATED edges if required SHEATHING Ť Stagger 1/8" spacing is end joints recommended at all (optional) edge and end joints unless otherwise indicated by panel manufacturer Asphalt or wood shingles Protect edges of or shakes. Follow Exposure 1 roofing manufacturer's panels recommendations for against roofing felt. exposure to weather, or use Exterior panel starter strip

**Note:** Cover sheathing as soon as possible with roofing felt for extra protection against excessive moisture prior to roofing application.

**Note:** For pitched roofs, place screened surface or side with skid-resistant coating up if OSB panels are used. Keep roof surface free of dirt, sawdust and debris, and wear skid-resistant shoes when installing roof sheathing.

**Note:** For buildings with conventionally framed roofs (trusses or rafters), limit the length of continuous sections of roof area to 80 feet maximum during construction, to allow for accumulated expansion in wet weather conditions. Omit roof sheathing panels in each course of sheathing between sections, and install "fill in" panels later to complete roof deck installation prior to applying roofing.

#### TABLE 28

#### RECOMMENDED MINIMUM FASTENING SCHEDULE FOR APA PANEL ROOF SHEATHING (Increased nail schedules may be required in high wind zones and where roof is engineered as a diaphragm.)

		Nailing <sup>(c)(d)</sup>		
		Maximum S	Spacing (in.)	
Panel Thickness <sup>(b)</sup> (in.)	Size <sup>(f)</sup>	Supported Panel Edges <sup>(e)</sup>	Intermediate	
5/16 - 1 1-1/8	8d 8d or 10d	6 6	12 <sup>(a)</sup> 12 <sup>(a)</sup>	

(a) For spans 48 inches or greater, space nails 6 inches at all supports.

(b) For stapling asphalt shingles to

5/16-inch and thicker panels, use staples with a 15/16-inch minimum crown width and a 1-inch leg length. Space according to shingle manufacturer's recommendations.

- (c) Use common smooth or deformed shank nails with panels to 1 inch thick. For 1-1/8-inch panels, use 8d ring- or screw-shank or 10d common smooth-shank nails.
- (d) Other code-approved fasteners may be used.
- (e) Supported panel joints shall occur approximately along the centerline of framing with a minimum bearing of 1/2". Fasteners shall be located 3/8 inch from panel edges.
- (f) See Table 5, page 13, for nail dimensions.

**Note:** Gluing of roof sheathing to framing is not recommended, except when recommended by the adhesive manufacturer for roof sheathing that already has been permanently protected by roofing.

APA RATED SHEATHING is equally effective under built-up roofing, asphalt or fiberglass shingles, tile roofing, or wood shingles or shakes. Roof trusses spaced 24 inches on center are widely recognized as the most economical construction for residential roofs. However, using fewer supports with thicker panels – e.g., 23/32- or 3/4-inch 48/24 panels over framing 48 inches on center – is also cost effective for long-span flat or pitched roofs. Recommended live loads are given in <u>Table 26</u>. Nailing recommendations are given in <u>Table 28</u>.

When support spacing exceeds the maximum length of an unsupported edge <u>(see Table 26)</u>, provide adequate blocking, tongue-and-groove edges, or other edge support such as panel clips. Some types of panel clips, in addition to edge support,

automatically assure proper panel spacing. When required, use one panel clip per span, except use two clips for 48-inch or longer spans.

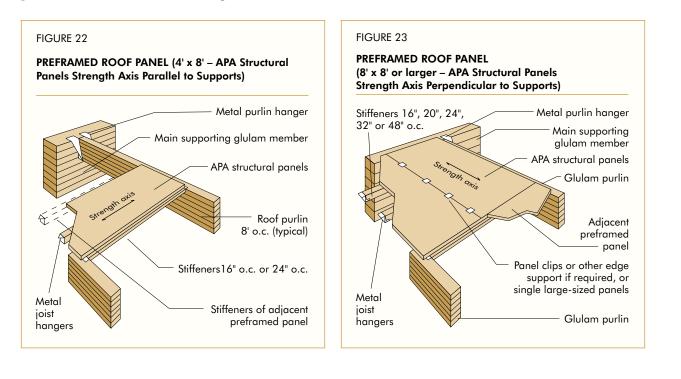

See <u>APA's Build A Better Home: Roofs</u>, Form A535, for additional recommended details to prevent moisture infiltration in roofs.

# **Preframed Roof Panels**

Spans of 8 to 12 feet are usually the most practical with preframed panel construction, although spans to 30 feet are not uncommon. Unsanded 4x8-foot APA panels with stiffeners preframed at 16 or 24 inches on center (Figure 22) are common. The long dimension or strength axis of the panel typically runs parallel to supports. Stiffeners and roof purlins provide support for all panel edges. Minimum nailing requirements for preframed panels are the same as for roof sheathing.

In preframed panels 8x8 feet or larger (Figure 23), the panel strength axis may run either parallel or perpendicular to stiffeners spaced 16 or 24 inches on center. Placing the strength axis across supports may require edge support such as panel clips or cleats between stiffeners at mid span in accordance with Table 26. Recommendations in <u>Table 29</u> are based on long dimension or strength axis of the panel parallel to supports. Deflection limits are 1/180 of the span for total load; 1/240 for live load only. See <u>Table 30</u> for design information on stiffeners for preframed panels. Nailing requirements for preframed panels are the same as for roof sheathing.

Form No. E30T = © 2005 APA – The Engineered Wood Association = www.apawood.org

#### TABLE 29

(d) Loads limited by stress are based on two conditions of duration of load: 2 months, such as for snow (1.15); and 7 days (1.25); includes effects of 10 psf dead load.

# Long Span Systems

Both preframed panel systems and direct application of sheathing to secondary or primary framing are common approaches in long span roof construction. Bay spacing and type of framing govern the choice.

Experience shows that panels over supports 48 inches on center often yield maximum economy. Panels with a Span Rating of 48/24 are good for at least 35 psf snow load and meet the requirements for most guaranteed or warranted roofs.

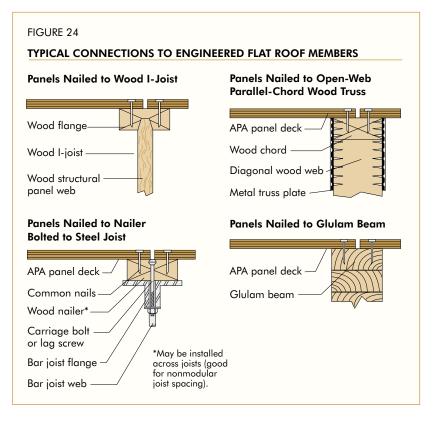

Figure 24 illustrates typical connections for engineered flat roof members.

# **Plywood Under Special Coatings**

TADLE 21

Chemical coatings for roofs have increased the range of design possibilities, particularly in larger commercial structures with contoured or steeply pitched roof surfaces exposed to view.

The plywood thickness and span recommendations in <u>Table 31</u> for plywood under special coatings assume installation with the **long dimension or strength axis of the panel perpendicular to supports** and liquid coatings applied directly to the plywood. Check local building codes for any required deviations from these recommendations. Allowable roof live load is based on the same deflection criteria as described in <u>Table 26</u> for APA panel roof sheathing.

	Minimum Plywood	Maximum Support Spacing (in.)			Maximu Spacin	-	
Grade	Thickness (in.)	Group 1	Groups 2 & 3	Group 4	Nail Type & Size <sup>(b)(e)</sup>	Supported Panel Edges	Intermediate Supports
	11/32	16	_	_	8d common smooth <sup>(a)</sup> or ring- or screw-shank	6	12
APA A-C EXT	15/32, 1/2	24	24	16	8d common smooth <sup>(a)</sup> or ring- or screw-shank	6	12
APA B-C EXT APA C-C PLUGGED EXT	19/32, 5/8	32	24	24	8d ring- or screw-shank	6	12
	23/32, 3/4	40	32	32	8d ring- or screw-shank	6	12
	7/8	48	40	40	8d ring- or screw-shank	6	12 <sup>(d)</sup>

(a) Use only deformed-shank nails for curved surfaces.

(b) Nail type, size and spacing may vary for engineered diaphragm designs.

(d) For spans 48 inches or greater, space nails maximum 6 inches at all supports.

(e) See Table 5, page 13, for nail dimensions.

(c) All panels will support at least 30 psf live load plus 10 psf dead load at maximum span.

Exterior plywood is recommended for use under special coatings for roofs. Where the coating requires a very smooth base, use APA A-C Exterior or APA B-C Exterior plywood. Where maximum smoothness is not essential, use APA C-C PLUGGED Exterior. Tongue-and-groove plywood (1/2 inch or thicker) or lumber blocking at panel edges is recommended. A 1/8-inch space is recommended at all edge and end joints unless otherwise indicated by panel manufacturer. If high-performance coatings are to be used for finish, check coating manufacturer's recommendations for panel joint treatment. Nail size, type and spacing recommendations are also given in Table 31.

Grades recommended in Table 31 should also be specified for the top layer when the structural wood deck is to be overlaid with a separate plywood layer to serve as substrate for special roof coatings. A 1/8-inch space is recommended at all edge and end joints unless otherwise indicated by panel manufacturer. Although minimum 1/4-inch plywood may be used over structural decks, 15/32 inch or thicker panels should be considered for best performance over uneven surfaces or when rain or high humidity is anticipated prior to application of roof coating. Use corrosion-resistant fasteners sized and spaced as recommended in Table 10.

# **APA Panel Soffits**

Recommended spans for open and closed APA panel soffits are given in <u>Tables 32 and 33</u>. The recommendations in Table 32 for open soffits also apply to combined roof/ceiling construction. **Panels are assumed continuous over two or more spans with the long dimension or strength axis across supports** for both applications. For appearance purposes in open soffit construction, provide blocking, tongue-and-groove edges, or other suitable edge support. Panels will support at least 30 psf live load, plus 10 psf dead load.

For open soffit and nonstructural ceiling construction, panels designated Exposure 1 are recommended as a minimum (check local building code) where appearance is not a major consideration.

) Space nails maximum 6 inches at intermediate supports for spans les supports for 48-inch spans.		<ul> <li>(c) For appearance purposes, bloc other suitable edge supports sh</li> <li>(d) See Table 5, page 13, for nail c</li> </ul>	ould be provided.
) Any suitable grade panel which me Exterior for closed soffits, Exposure ceiling.		(+) <u></u>	

Only Exterior panels should be used for closed soffits.

At eaves where Exposure 1 sheathing is used for roof decking, protect panel edges against direct exposure to the weather with fascia trim.

Although unsanded and touch-sanded grades of plywood are often used for applications such as soffits, optimum appearance and finish performance is attained by using panels with textured or sanded A-grade faces. For panel grades other than APA RATED SIDING 303, top-quality acrylic latex house paint systems provide best performance (see page 50). Facechecking (separations between fibers parallel to the grain of the face veneer) can be expected on non-overlaid plywood which is exposed to the outdoors, even when finished. If a smooth, check-free surface is desired, use Medium Density Overlay (MDO) plywood.

# **APA Panel Roof Diaphragms**

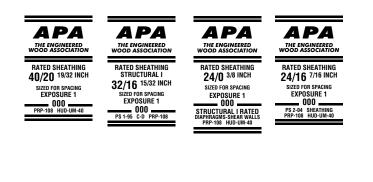

With only slight design modifications, any APA panel roof deck system described in the previous sections will also function as an engineered diaphragm to resist high wind and seismic loading. A diaphragm's ability to function effectively as a beam, transferring lateral loads to shear walls, is related to the quality of the connections. Nailing is critical since shear loads are transmitted through these fasteners. Common nails provide required strength. Other nail types may be used when their lateral bearing values are considered in the design. Load-carrying capacity is highest when the diaphragm is blocked. Where 1-1/8" roof panels are desired, such as for Heavy Timber construction (see page 66), shear values for 19/32" panels are used. Blocked shear values for 1-1/8" panels may be obtained by specifying stapled T&G edges. Staples shall be 16 gauge, 1" long with a 3/8" crown, driven through the T&G edges 3/8" from the joint so as to penetrate the tongue. Staples shall be spaced at one-half of the boundary nail spacing for <u>Cases 1 and 2</u>, and at one-third the boundary nail spacing for <u>Case 3</u> through 6, as illustrated in <u>Table 34</u>. Table 34 gives panel and fastening recommendations for roof diaphragms. Panels and framing are assumed already designed for perpendicular loads. To design a diaphragm, follow these steps:

1. Determine lateral loads and resulting shears.

2. Determine nailing schedule (Table 34). Consider load direction with respect to joints.

**3.** Compute chord stress due to bending moment. Provide adequate splices. Check deflection. Check anchorage of boundary framing (e.g., chords) to walls.

For information about developing higher diaphragm shears than shown in Table 34, See <u>Diaphragms and Shear Walls, APA</u> Form L350.

- (a) For framing of other species: (1) Find specific gravity for species of lumber in the AFPA National Design Specification. (2) Find shear value from table above for nail size for actual grade. (3) Multiply value by the following adjustment factor: Specific Gravity Adjustment Factor = [1 (0.5 SG)], where SG = specific gravity of the framing. This adjustment shall not be greater than 1.
- (b) Space nails maximum 12 inches o.c. along intermediate framing members (6 in. o.c. when supports are spaced 48 in. o.c. or greater). Fasteners shall be located 3/8 inch from panel edges.
- (c) Framing at adjoining panel edges shall be 3-in. nominal or wider, and nails shall be staggered where nails are spaced 2 inches o.c. or 2-1/2 inches o.c.

(d) Framing at adjoining panel edges shall be 3-in. nominal or wider, and nails shall be staggered where 10d nails having penetration into framing of more than 1-5/8 inches are spaced 3 inches o.c.

(e) 8d is recommended minimum for roofs due to negative pressures of high winds.

(f) See Table 5, page 13, for nail dimensions.

**Notes:** Design for diaphragm stresses depends on direction of continuous panel joints with reference to load, not on direction of long dimension or strength axis of sheet. Continuous framing may be in either direction for blocked diaphragms.

## **ADDITIONAL INFORMATION**

#### About APA – The Engineered Wood Association and Engineered Wood Systems

*APA* – *The Engineered Wood Association* is a nonprofit trade association of and for structural wood panel, glulam timber, wood I-joist, laminated veneer lumber, and other engineered wood product manufacturers. Based in Tacoma, Washington, APA represents approximately 150 mills throughout North America, ranging from small, independently owned and operated companies to large integrated corporations.

Always insist on engineered wood products bearing the **mark of quality** – the APA or *APA EWS* trademark. Your APA engineered wood purchase is not only your highest possible assurance of product quality, but an investment in the many trade services that APA provides on your behalf. The Association's trademark appears only on products manufactured by member mills and is the manufacturer's assurance that the product conforms to the standard shown on the trademark.

For panels, that standard may be an APA performance standard, the Voluntary Product Standard PS 1-95 for Construction and Industrial Plywood or Voluntary Product Standard PS 2-04, Performance Standards for Wood-Based Structural-Use

Panels. Panel quality of all APA trademarked products is subject to verification through APA audit.

The APA EWS trademark appears only on engineered wood products manufactured by members of Engineered Wood Systems, a division of APA. The mark signifies that the manufacturer is committed to a rigorous program of quality verification and testing and that products are manufactured in conformance with an APA or national standard such as ANSI Standard A190.1, American National Standard for Structural Glued Laminated Timber or with a manufacturer's building code evaluation report.

APA's services go far beyond quality testing and inspection. Research and promotion programs play important roles in developing and improving plywood and other panel construction systems, and in helping users and specifiers to better understand and apply engineered wood products. For more information, please see the back cover.

In 1905, a small wooden box company produced the first softwood plywood. Displayed that year at the World's Fair in Portland, Oregon, the Douglas-fir "3-ply veneer work" soon caught attention

and became a thriving national and international industry. APA, which was founded in 1933 as the Douglas Fir Plywood Association, is celebrating the plywood centennial in 2005. For more information, please visit <u>www.apawood.org/plywoodcentennial.</u>

# ENGINEERED WOOD CONSTRUCTION GUIDE

APA offers a comprehensive set of services and tools for design and construction professionals specifying and using engineered wood products and building systems. If you're looking for detailed product information, training material, or technical assistance, APA can help.

- **www.apawood.org**, APA's web site, is your link to in-depth design and building support, including a library of more than 400 publications available for instant pdf download or hard-copy purchase.
- **help@apawood.org**\_or (253) 620-7400 is your connection to the APA Product Support Help Desk. Staffed by specialists who have the knowledge to address a diverse range of inquiries related to engineered wood, the Help Desk can answer your questions about specification and application of APA products.

# Tap into APA's extensive knowledge and resources.

Training materials and assistance, including Wood University, APA's online portal for engineered wood education, located at <u>www.wooduniversity.org</u>

Information to protect homes against damaging moisture infiltration through the Build a Better Home and Free From Mold programs, including guides and details for builders at <u>www.buildabetterhome.org</u> and an inspection regimen for homeowners at <u>www.freefrommold.org</u>

More than 100 downloadable CAD details, found at <u>www.apacad.org</u>

• Field representatives in many major U.S. cities and Canada who can answer questions about APA trademarked products

For a list of APA and APA EWS publications, request or download the APA Publications Index, Form B300, or the EWS Publications Index, Form S400, at <u>www.apawood.org/publications.</u>
